Summary

This guide introduces first-time users to StreamCut Pro 1.0, the desktop video editing application distributed by XYZ Corporation. It covers installation, importing media, working with the single-track timeline, performing basic trim and cut operations, and exporting a finished video in MP4 format. This is the foundational release aimed at users producing simple cuts without advanced color or multi-track needs.

1. Introduction

StreamCut Pro is XYZ Corporation's desktop video editing application, designed to give end users a straightforward path from raw footage to a shareable video file. Version 1.0 focuses on the core editing loop: import, trim, arrange, and export.

This guide is written for End Users with no prior video editing experience. Readers who need render-farm or compliance procedures should instead consult the StreamCut Pro Standard Operating Procedure (SOP) for Video Rendering & Export.

2. System Requirements and Installation

StreamCut Pro 1.0 requires Windows 10 (64-bit) or macOS 11 or later, 8 GB of RAM, and 4 GB of free disk space. A dedicated GPU is recommended but not required for standard-definition and 1080p editing.

- Download the installer from the XYZ Software Portal using your corporate credentials.
- Run the installer and accept the End User License Agreement.
- Launch StreamCut Pro and sign in with your XYZ single sign-on account.

3. Importing Media

Media is brought into a project through the Import panel. StreamCut Pro 1.0 supports MP4, MOV, and WAV source files.

1. Select File > Import Media, or drag files directly onto the Media Bin.
2. Choose the source files from local disk. Network drives are supported but not recommended due to slower scrubbing performance.
3. Confirm the clips appear as thumbnails in the Media Bin before proceeding to the timeline.

4. Working with the Timeline

Version 1.0 provides a single video track and a single audio track. This is intentionally simple: clips are arranged left to right in the order they will play.

- Drag a clip from the Media Bin onto the timeline to add it.
- Drag the edge of a clip to trim its in or out point.
- Use the Split tool (keyboard shortcut S) to cut a clip at the playhead position.
- Reorder clips by dragging them left or right along the track.

5. Basic Trim and Cut Operations

Trimming shortens a clip from either end without removing it from the timeline. Cutting (splitting) divides one clip into two independent clips that can then be deleted, moved, or reordered independently.

Action	Shortcut	Result
Trim in-point	Drag left edge	Shortens clip start
Trim out-point	Drag right edge	Shortens clip end
Split at playhead	S	Creates two clips
Delete selected clip	Delete	Removes clip, leaves gap
Ripple delete	Shift+Delete	Removes clip, closes gap

6. Exporting Your Project

When editing is complete, use File > Export to render a shareable file. Version 1.0 supports a single output format: MP4 (H.264) at up to 1080p resolution.

4. Select File > Export.
5. Choose an output resolution of 720p or 1080p.
6. Choose a destination folder on local disk.
7. Click Start Export and wait for the progress bar to complete.

7. Troubleshooting Common Issues

Most first-time issues relate to unsupported file formats or insufficient disk space during export.

- If a clip fails to import, confirm it is MP4, MOV, or WAV — other formats are not supported in 1.0.
- If export fails partway through, confirm at least 2x the source footage size is free on the export drive.
- If playback stutters, close other applications to free system memory; 1.0 does not yet support proxy media.

8. Warnings & Constraints

⚠ Important Notices

- StreamCut Pro 1.0 does not support multi-track editing, color grading, or GPU-accelerated export — see version 2.0 or later for these capabilities.
- Projects created in 1.0 are not forward-compatible guarantee-free across major versions; always keep a copy of source media separate from the project file.
- Do not edit project files directly from a network share; this can cause project corruption on unexpected disconnects.
